# SUMMARY OF THE PROVED-SIRE RECORDS COMPILED IN 1955

The following tabulations give a brief summary of the proved-sire records compiled from dairy-herd-improvement-association data in 1955:

Table 1. --Number of sires reported alive or dead, and the production of their daughters compared with that of the daughters' dams

Status of sires	Average production

1/ The number listed for each State frequently includes 1 or more sires proved with records from some other State as well as from the State indicated.

2/ The totals given here omit duplication of sires.

3/ 28 of the American Dairy Cattle Club sires were also registered in other breed associations.

# DHIA PROVED-SIRE RECORDS TABULATED IN MARCH 1956

Following is a list of 481 sires whose records were tabulated or retabulated by the Dairy Husbandry Research Branch in March 1956. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., \*12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month, and year (i. e., \*May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

Proved-sire records consisting of fewer than 25 comparisons with daughters resulting from artificial breeding are indicated as "preliminary AB proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire record.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
